

CASE STUDY

Cliff Quay

The issue

Upgrade required

The project required an upgraded liftable grid system to increase efficiency and performance at the Ipswich WwTW.

The solution

Solutions focused

The project involved some operational challenges to allow the installation to go without interruption to the process. This involved breaking into the pipe to replace sections of the pipe within a short time frame, restricting the amount of time air flow could be stopped to allow the manufacturing to take place.

The result

Live installation

Suprafil installed a liftable grid system without draining the tanks during the live installation project valued at £320,000 – working in close partnership with the operators of the Wastewater Treatment Works on behalf of Anglian Water.
